Mission of the Gaia-X Lab

Sunday, 27
March 2022

What is the Gaia-X Lab?

- The Gaia-X Lab is a **development team** under the Gaia-X CTO office.
- The Gaia-X Lab team writes prototypes to **technically validate functional and technical hypothesis** made by the Gaia-X Working Groups, when working on the Gaia-X specifications.
- The team **demonstrates working prototypes**.
- The Lab **accelerates the development** of external **open-source software (OSS)** project.
- The Lab **identifies missing functional components** in the Gaia-X Specifications

Deliverables of the Gaia-X Lab?

- **All results of the prototyping activities are shared** with the Gaia-X Working Groups and the Gaia-X Lighthouses projects for their own considerations.
- The Gaia-X Lab **doesn't contribute to the Gaia-X specs**.
- The Gaia-X Lab **doesn't release any official Gaia-X deliverables**.
- **All working activities are publicly done** in the current repository.

Public Repository: **https://gitlab.com/gaia-x/lab**

Public Backlog: **https://gaia-x.atlassian.net/browse/LAB**

What happens with the Code?

Type	Use Case	Action
Accelerator	The prototype is a feature of an existing OSS project.	It's contributed back to the OSS project.
Filler	The prototype identified a missing Gaia-X Component.	It's released as a new OSS project under the Eclipse Foundation.
Demonstrator	The prototype showcases a workflow for educational purpose	It's released as a new OSS project under the Gaia-X OSS rules.

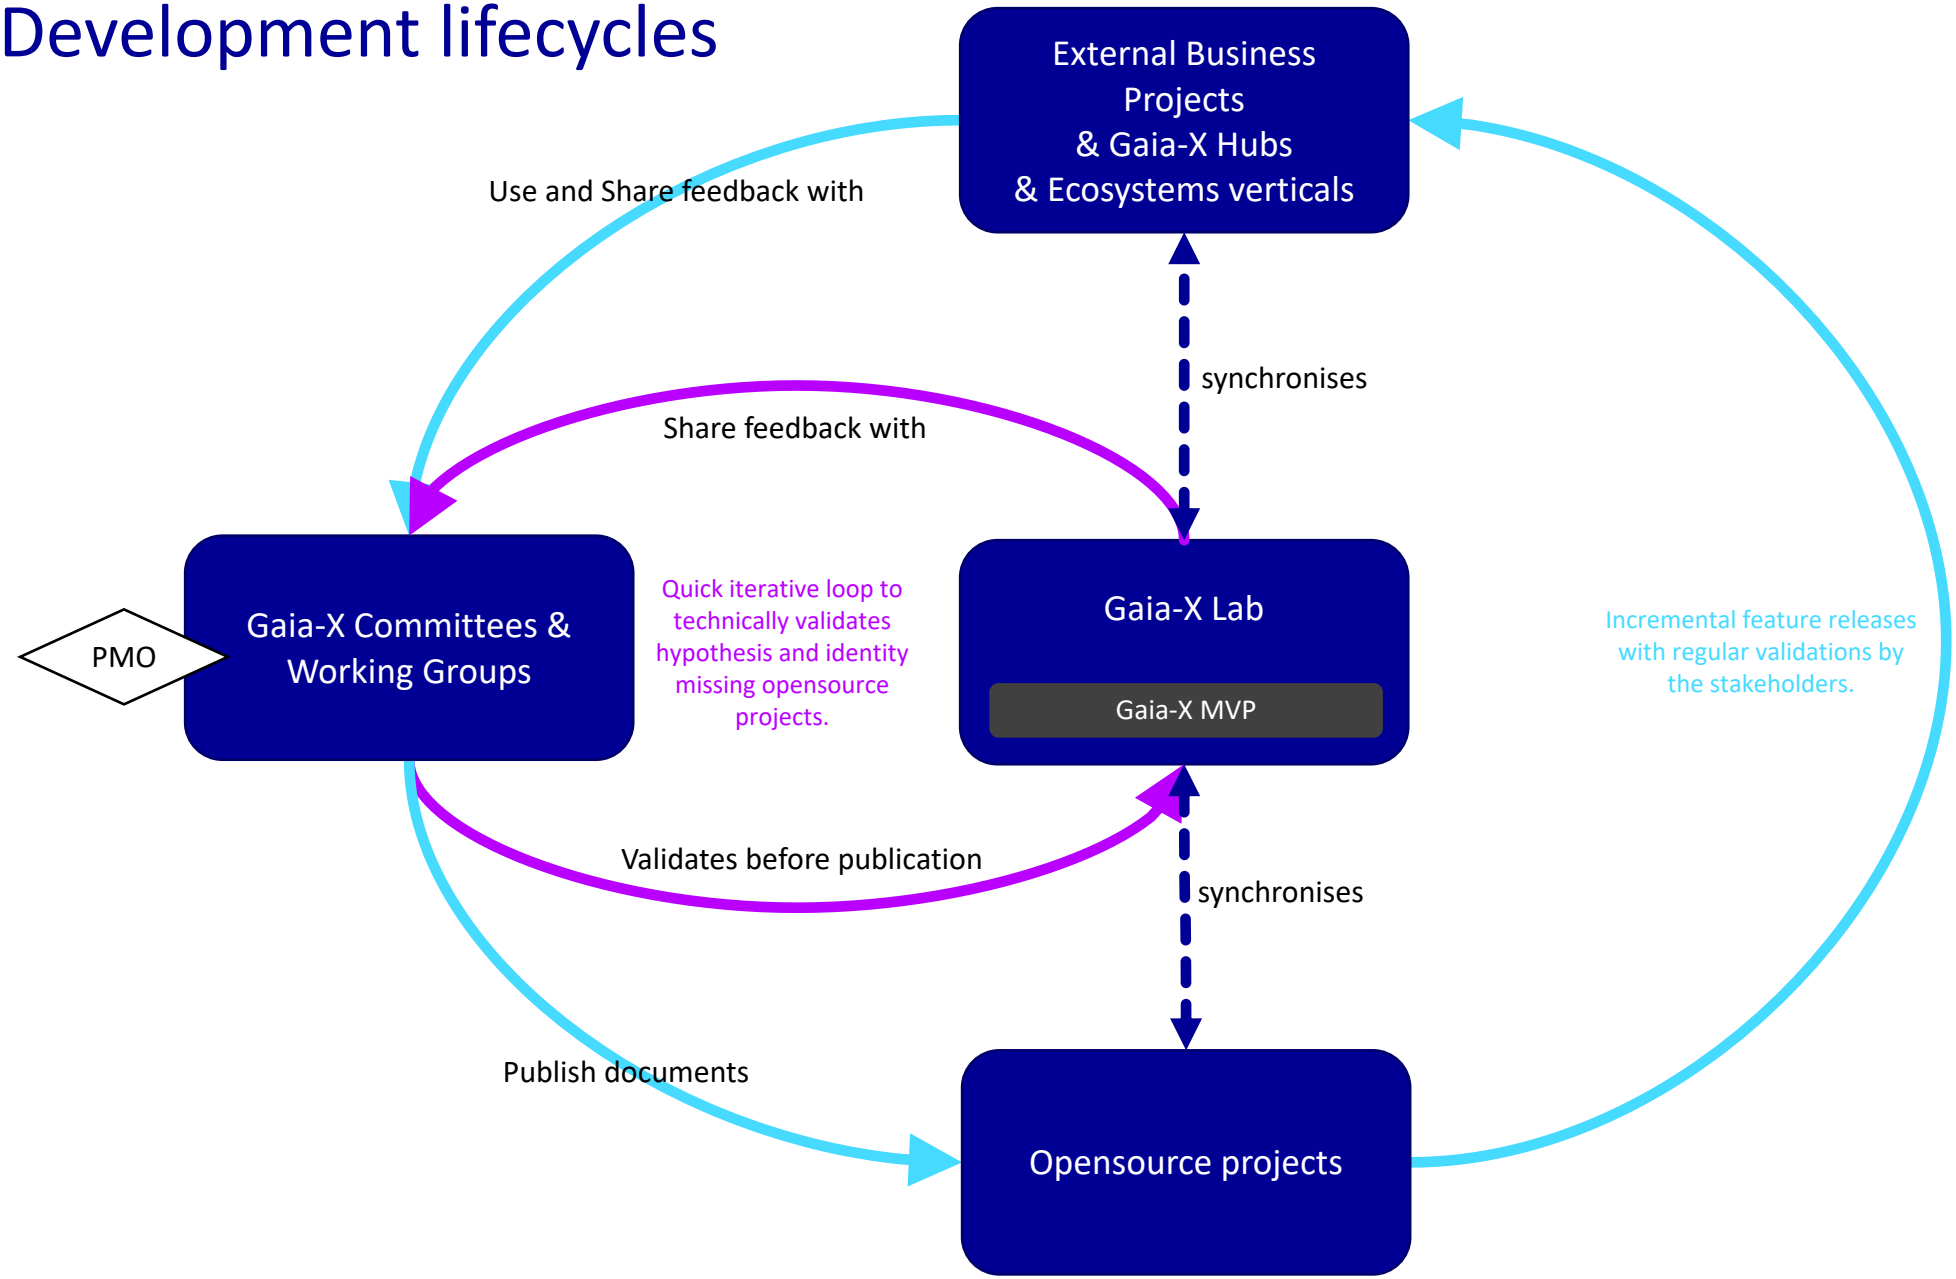
All Gaia-X Lab projects follow the **Gaia-X OSS rules**.

The license is either **Apache License Version 2.0** or **Eclipse Public License - v 2.0**.

02

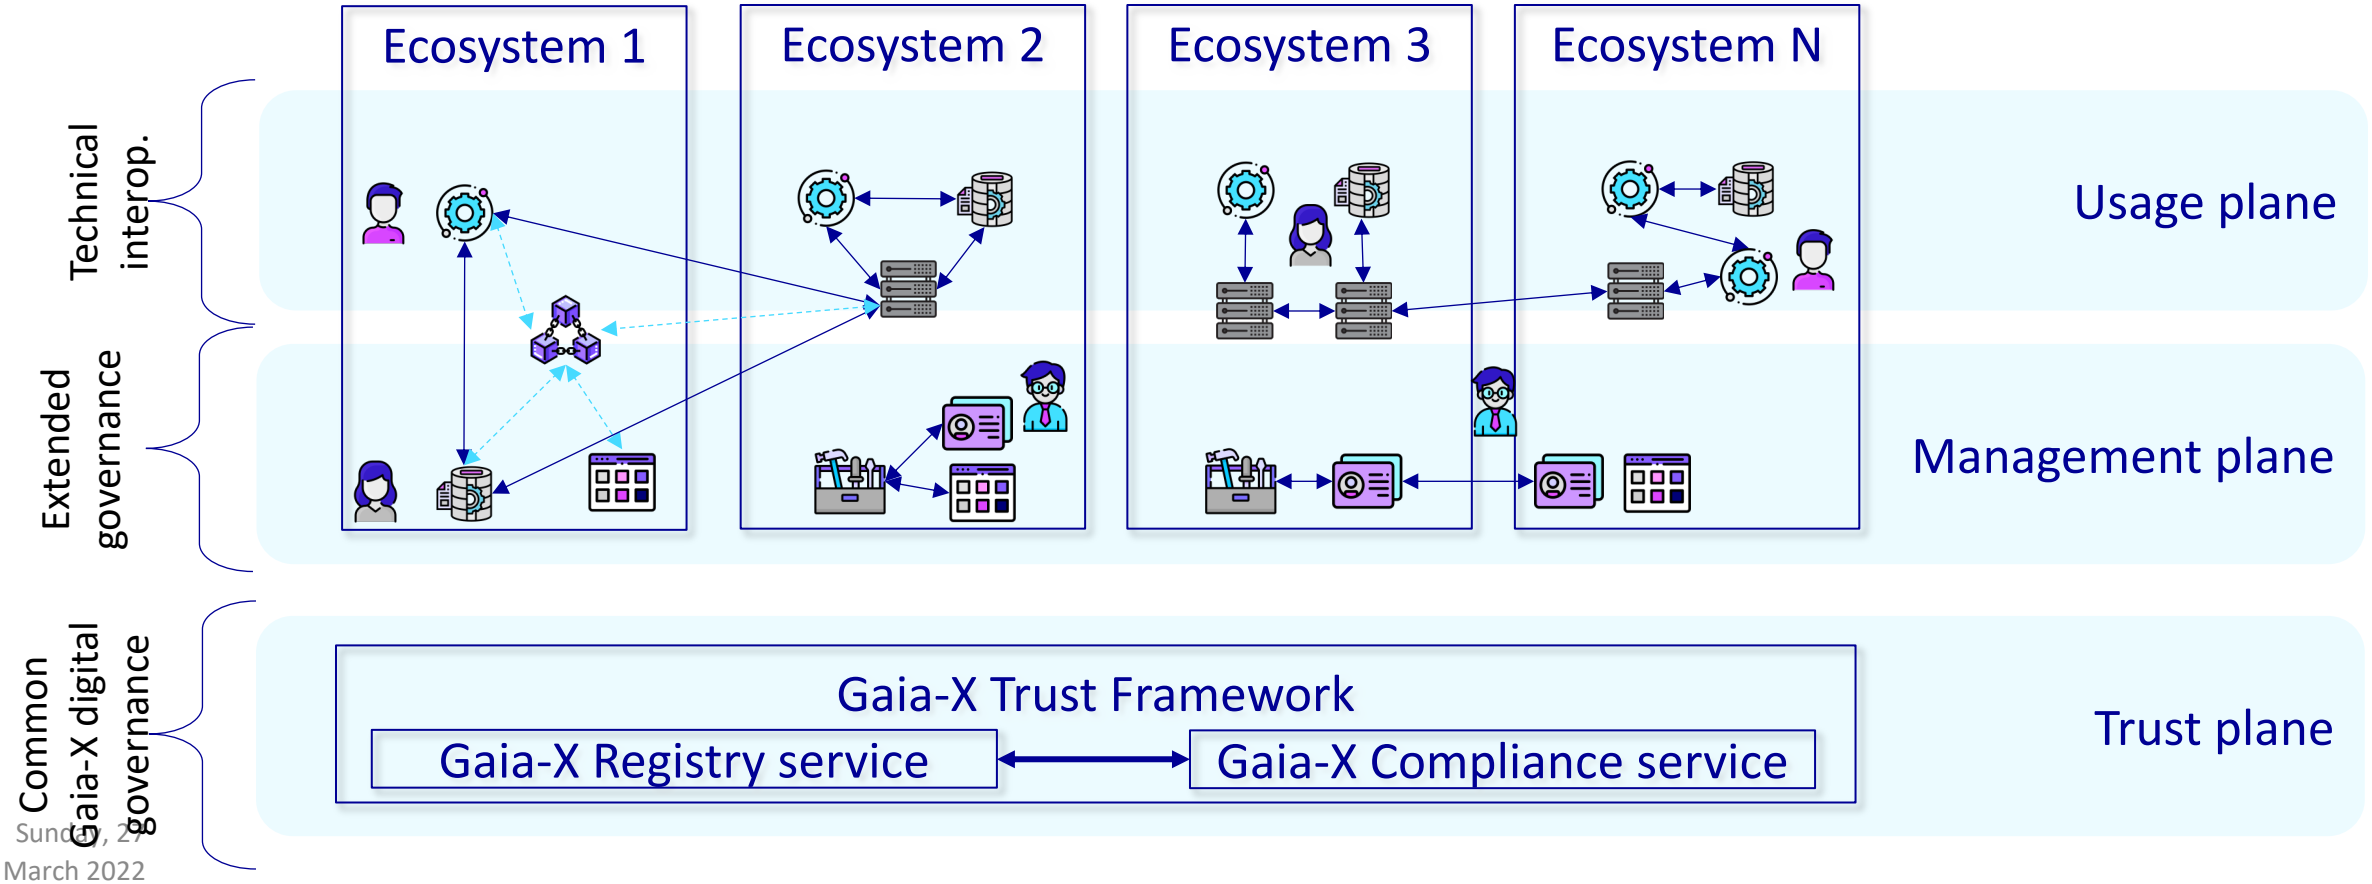
Context of the Gaia-X Lab

Development lifecycles



One **Gaia-X Ecosystem,** federating **interoperable autonomous ecosystems**.

- **Gaia-X Ecosystem:** the virtual set of Participants, Service Offerings, Resources fulfilling the requirements of the **Gaia-X Trust Framework.**



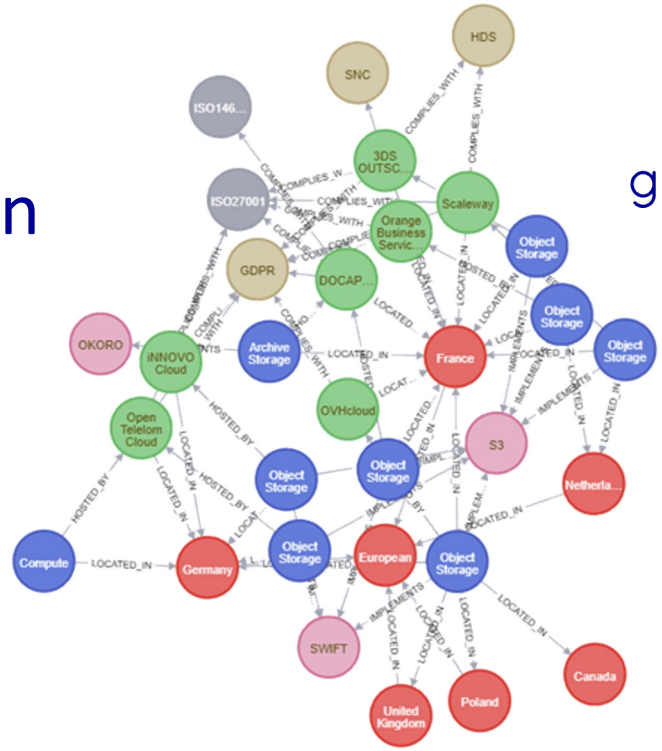
NIST 500-332: Cloud Federation Reference Architecture (§2)

Federation Services toolbox | Service catalogue | Federator | Participants | DLT | Verifiable Credential Wallet

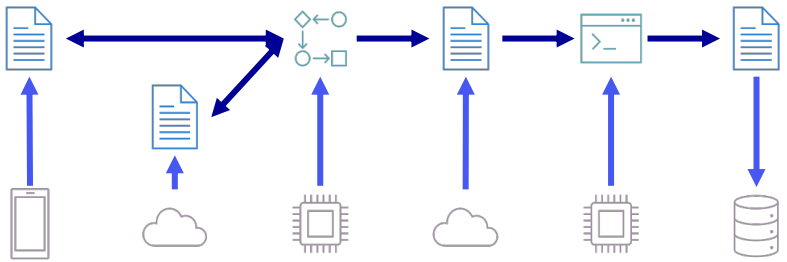
Gaia-X Trust Framework 1/2
from fragmented market to service composition

- Enable the **creation of more complex composite services from atomic or elementary services** as well as complex services.

  - Ensuring **composability** and hence **substitution**
  - Creates **Transparency** with **portability across providers** and hosting platforms



Knowledge graph of verifiable and composable signed claims
(Catalogue demonstrator - March 2020)



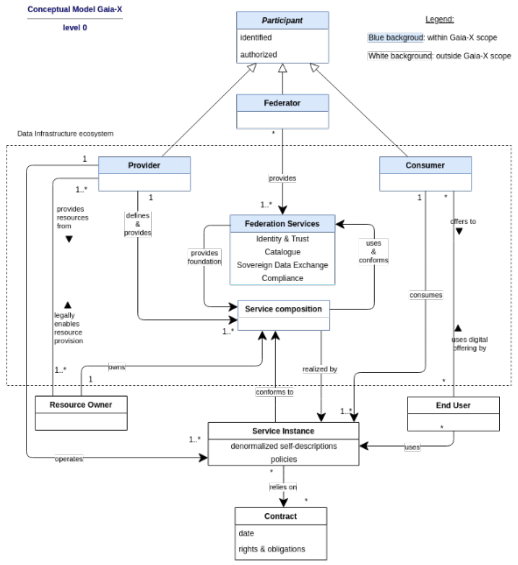
Data pipeline example, from edge (mobile) to cloud

Gaia-X Trust Framework 2/2

To ensure **Trust** the Gaia-X Trust Framework is:

- **Automated by Gaia-X specific components** part of decentralized technology framework
- Versioned, i.e. **bound to** a specific version in time of the **Compliance rules set**
- **Applied to the self-description** file of all entities implied in the Gaia-X conceptual model (*)
- Aimed to **verify the existence and veracity of the attributes** and not judging their value

(*) as defined as part of the Gaia-X Conceptual model described in the Gaia-X Architecture document



The content
Verify if the mandatory attributes are filled in and if the values are verified.

Set of claims

attribute: value
attribute: value
attribute: value
.....

The envelop
Verify the keypair issuers and cryptographic signatures

Claims
Machine readable or plain English

```

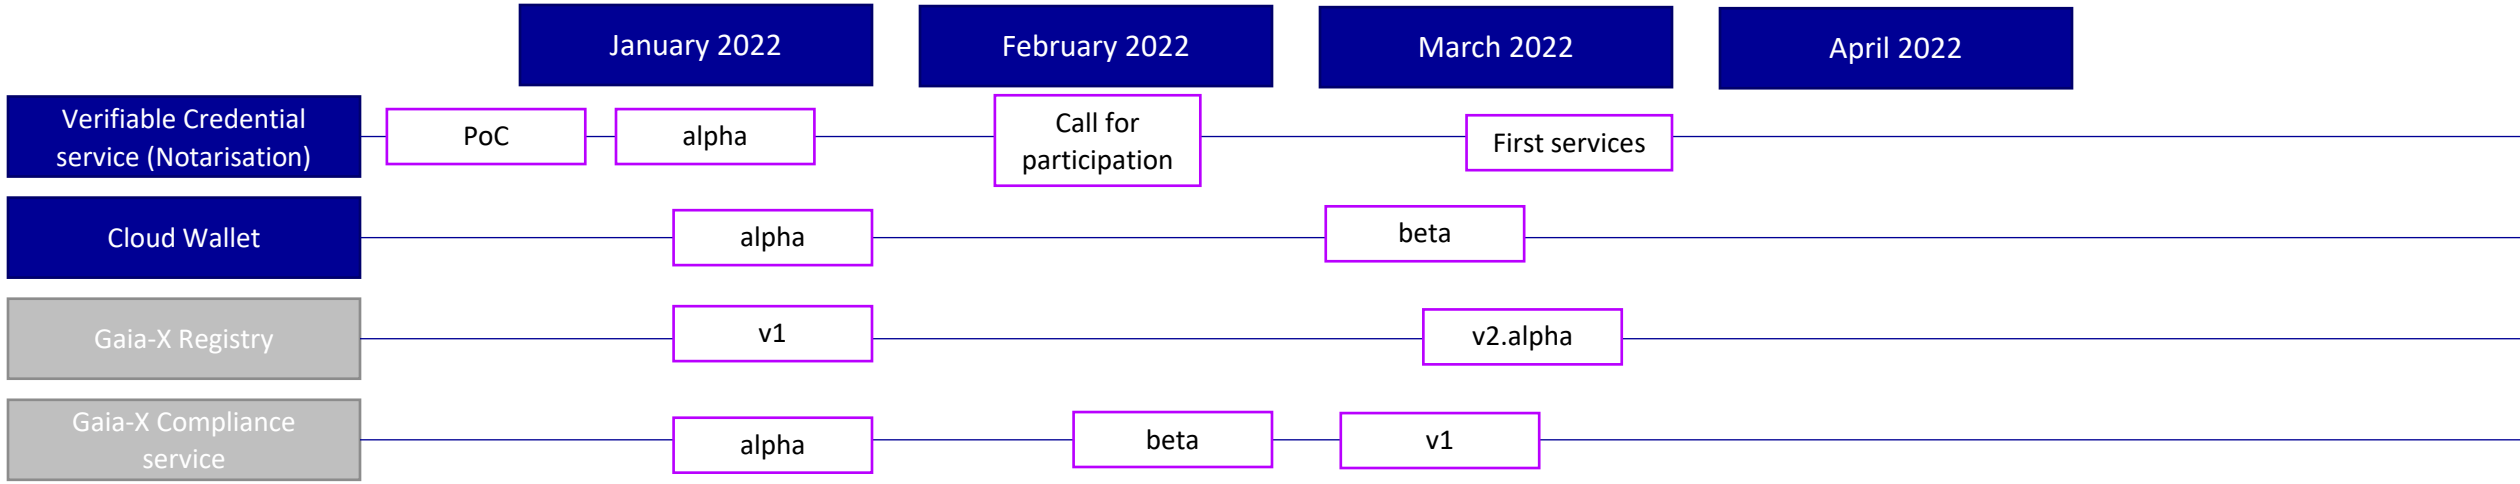
- Trust Framework example:
  - All cars must have a color
  - All Datasets must have a location
  - All Services must identify their provider with its legal country of jurisdiction.
- Label examples:
  - cars level 1 are red, cars level 2 are blue, …
  - My dataset must be located in EU
  - My services must be non-subject/immune to non-EU laws

03

Roadmap

Roadmap and Focus



- Demonstration of the **Trust Framework**, Self-Sovereign Identity (SSI) & Verifiable Credentials

Gaia-X defined
Gaia-X owned
External project

- Alpha Version of **Gaia-X Registry**

- First verification of **Gaia-X Compliance**

- **Trust Framework:** https://gaia-x.gitlab.io/policy-rules-committee/trust-framework/

04

3. List of defined trust anchors

Name	Defined as
State	The Trust Service Providers (TSP) must be a state validated identity issuer. - For `participant`, if the `legalAddress.country` is in EEA, the TSP must be **eIDAS** compliant. - Until end of 2022 Q1, to ease the onboarding and adoption this framework **DV SSL** can also be used. - **Gaia-X** association is also a valid TSP for Gaia-X association members.
eiDAS	Issuers of Qualified Certificate for Electronic Signature as defined in eIDAS Regulation (EU) No 910/2014 (homepage: https://esignature.ec.europa.eu/efda/tl-browser/#/screen/home) (machine: https://ec.europa.eu/tools/lotl/eu-lotl.xml)
DV SSL	Domain Validated (DV) Secure Sockets Layer (SSL) certificate issuers are considered to be temporarily valid Trust Service Providers. (homepage: https://wiki.mozilla.org/CA/Included_Certificates) (machine: https://ccadb-public.secure.force.com/mozilla/IncludedCACertificateReportPEMCSV)
Gaia-X	*To be defined after 2022Q1.*
EDPB CoC	List of Code of Conduct approved by the EDBP (homepage: https://edpb.europa.eu/our-work-tools/documents/our-documents_fr?f%5B0%5D=all_publication_type%3A61&f%5B1%5D=all_topics%3A125)
gleif	List of registered LEI issuers. (homepage: https://www.gleif.org/en/about-lei/get-an-lei-find-lei-issuing-organizations) (machine: https://api.gleif.org/api/v1/registration-authorities)

Demonstrator: **https://registry.gaia-x.eu/api-docs/#/Trust%20Anchor/post_api_trustAnchor**

Repositories: **https://gaia-x.atlassian.net/browse/LAB**

Features of the Gaia-X Onboarding Demonstrator

- **Demonstrates working prototype** of the Trust Framework
- **Validates functional and technical hypothesis** made by the Gaia-X Working Groups
- **Accelerates the development** of free open-source software (FOSS)
- **Issues and verifies** Gaia-X Participant Credentials, based on Self-Descriptions
- Leverages Gaia-X Participants Credentials for Access Control
- Provides a **first Version of the Gaia-X Registry**

Technology

- SSI Kit provided by walt.id under Apache 2.0 License, extended for Gaia-X
- Communication via HTTPS
- Using Decentralized IDentifiers (DIDs), JSON LD-based Credentials,based on DID:WEB
- Using Open ID Connect for Verifiable Presentations (OIDC4VP)
- Using Self-Issued Open Identity Provider v2 (SIOPv2)
- Cryptosuite (RSA and ED25519, SECP256K1 and others also possible)
- Registry can be used to find and verify the keys of Trust Anchors

05

Demonstration and Flows

Actors

Participant

- Gaia-X Participant undergoing a demo KYB process to **receive a Gaia-X Credential**

Federator / AISBL

- Gaia-X Federator / Gaia-X AISBL **providing Identity Services and Credentials**

Service Provider

- Gaia-X Service Provider **offering a service** to accredited Gaia-X Participants

Documents & Tools

Ecosystem self-description wizard tool

- Self-Description Generator

- Self-Description of a Participant

Verifiable Credential

- Verifiable Credentials signed by the Participant and the Federator / AISBL

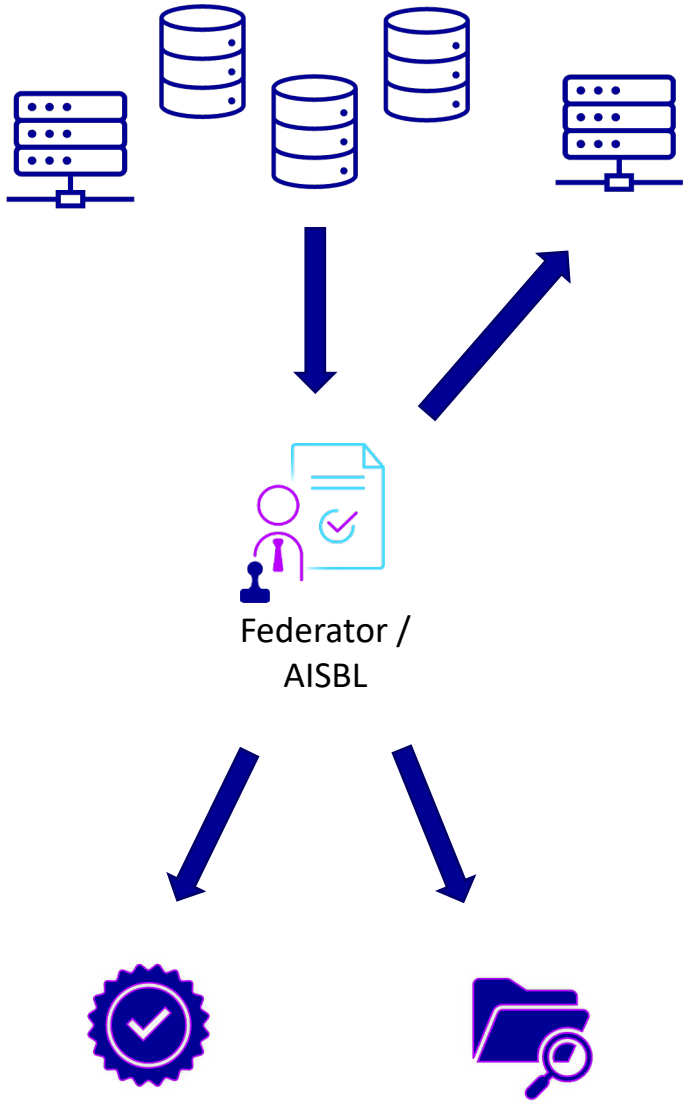
Verifiable Credentials Wallet

- Set of Credentials held by the Participant in a Credential Manager / Wallet

Infrastructure

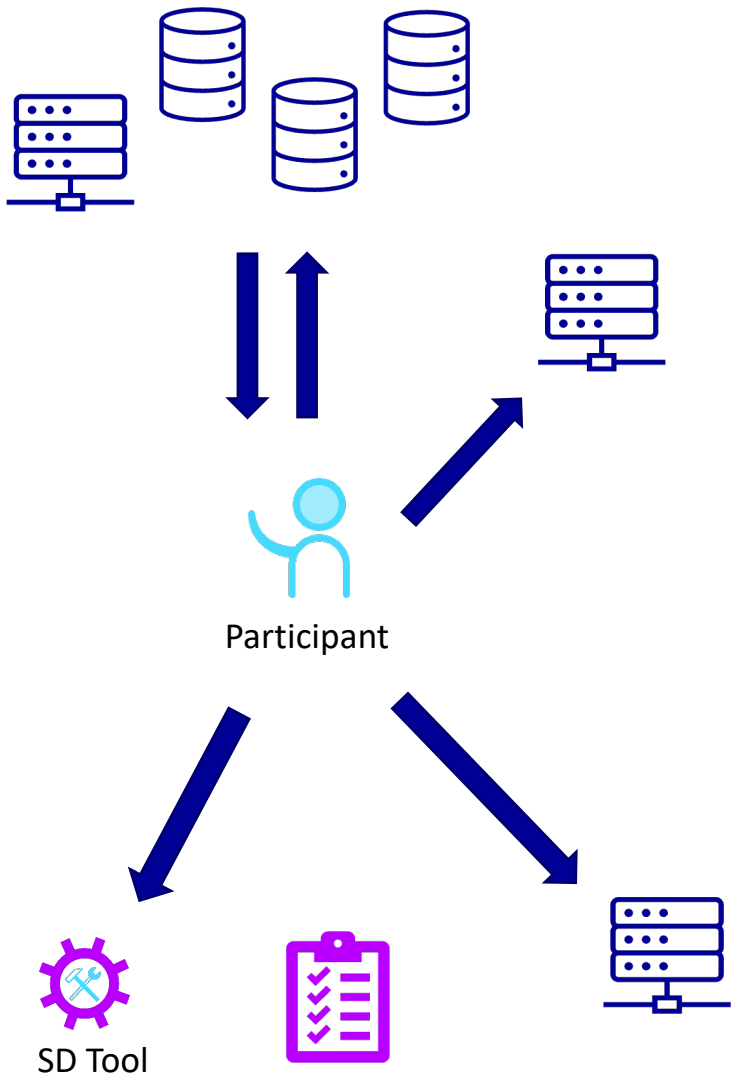
- Private Database containing information about participants
- Public Webserver to provide frontends
- Issuer / Signatory
- Verifier
- Credential Manager / Wallet

Gaia-X AISBL / Federator



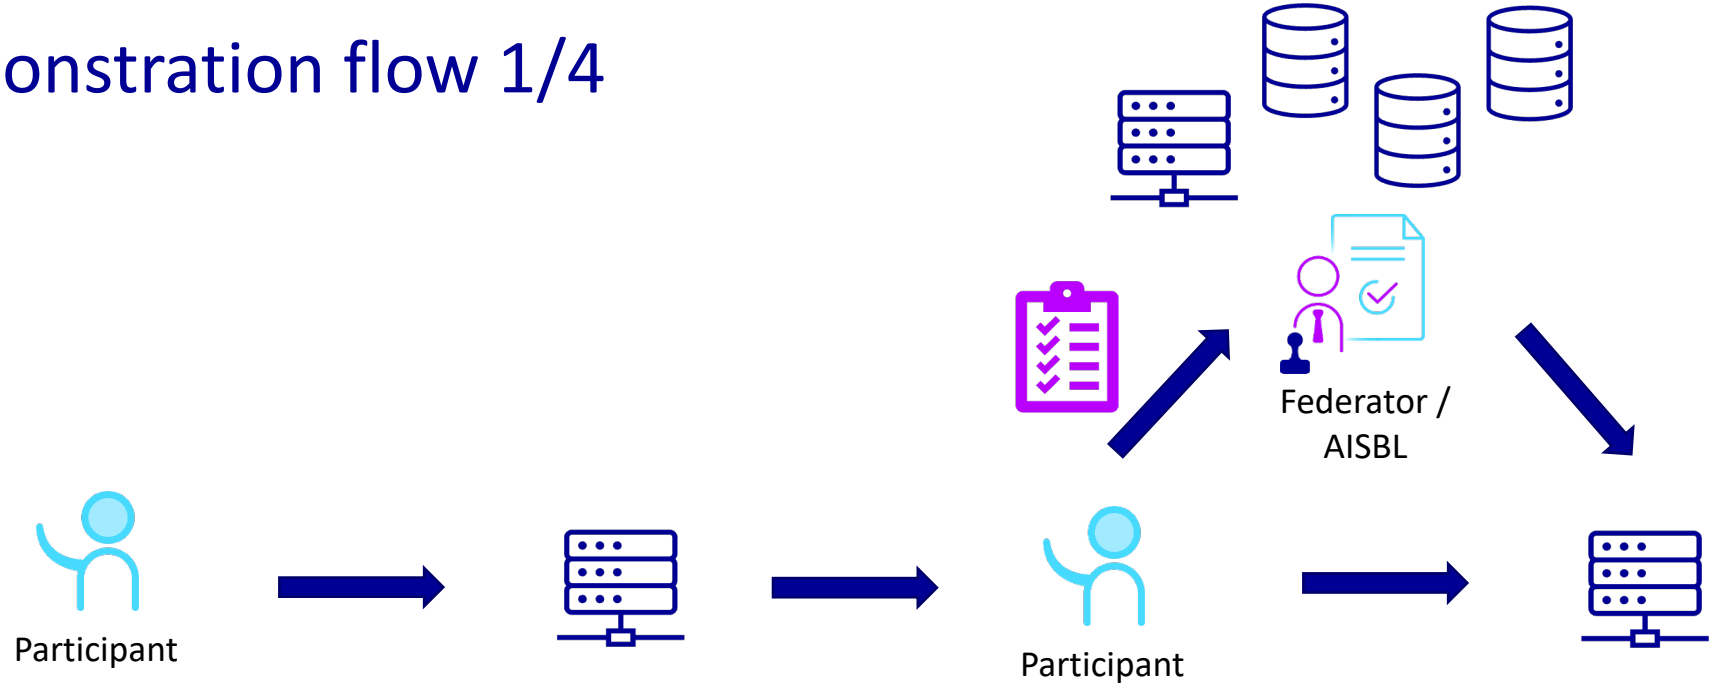
- Federator / AISBL checks **information from Trusted Data Sources**
- AISBL **provides Trust Framework**, Federator **follows Trust Framework**
- Federator / AISBL public key is listed in the **Gaia-X Registry** as Issuer
- Federator provides **Onboarding Portal** for Accreditation
- Identification via public key in **DID:WEB via public Webservice**
- Federators provide **Credential Issuer / Signatory**
- Federators provide **Credential Validator Service / Verifier**

Participant / Service Provider



- Participant is registered with **Trusted Data Sources**
- Participant public key is NOT listed in the **Gaia-X Registry**
- Participant creates **Self-Description** using SD Toolkit
- Participant uses **Onboarding Portal** for Accreditation
- Participant operates a **public Webservice** (optional)
- Participant has **access to a Credential Manager**

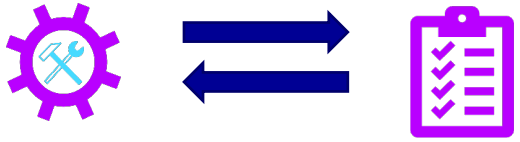
Demonstration flow 1/4



Participant (OpenID Provider) visits the Onboarding Portal to receive a Credential

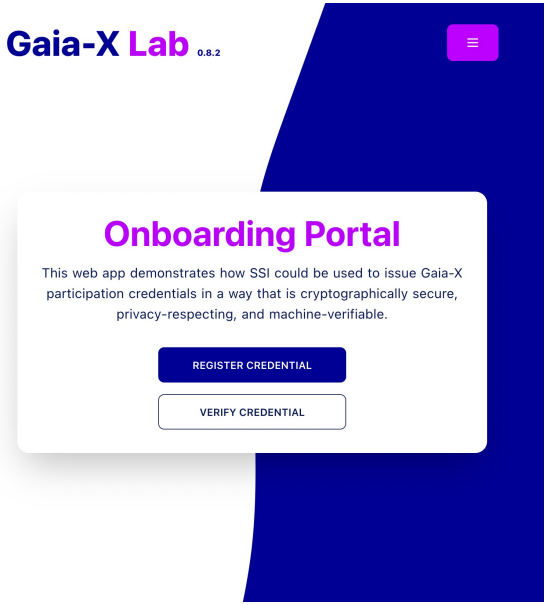
Onboarding Portal requests e-mail address to verify the Participant

The participants receives access to the Onboarding Service

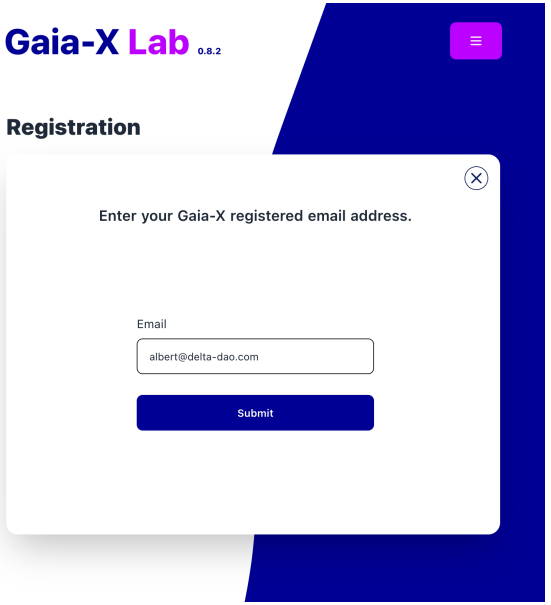


This represents a full KYB process in which the AISBL / Federator checks the provided information (SD) with Trusted Data Sources and verifies the integrity of the SD & identity.

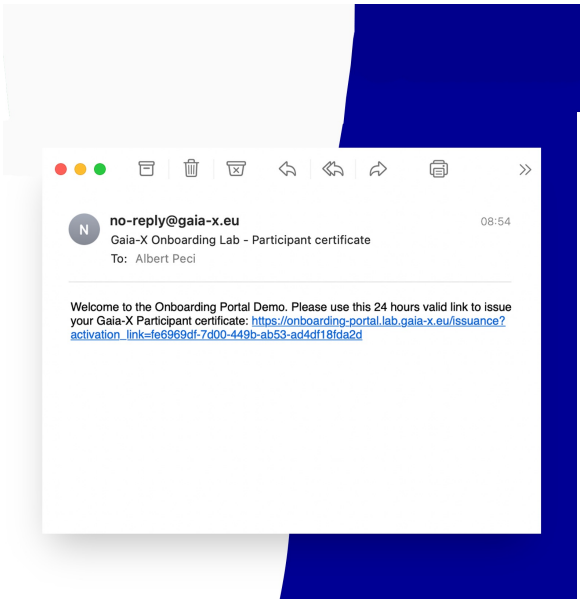
Demonstration flow 2/4



1. Visit the Gaia-X Lab Onboarding Portal and select *Register Credential.* This will start the onboarding flow.

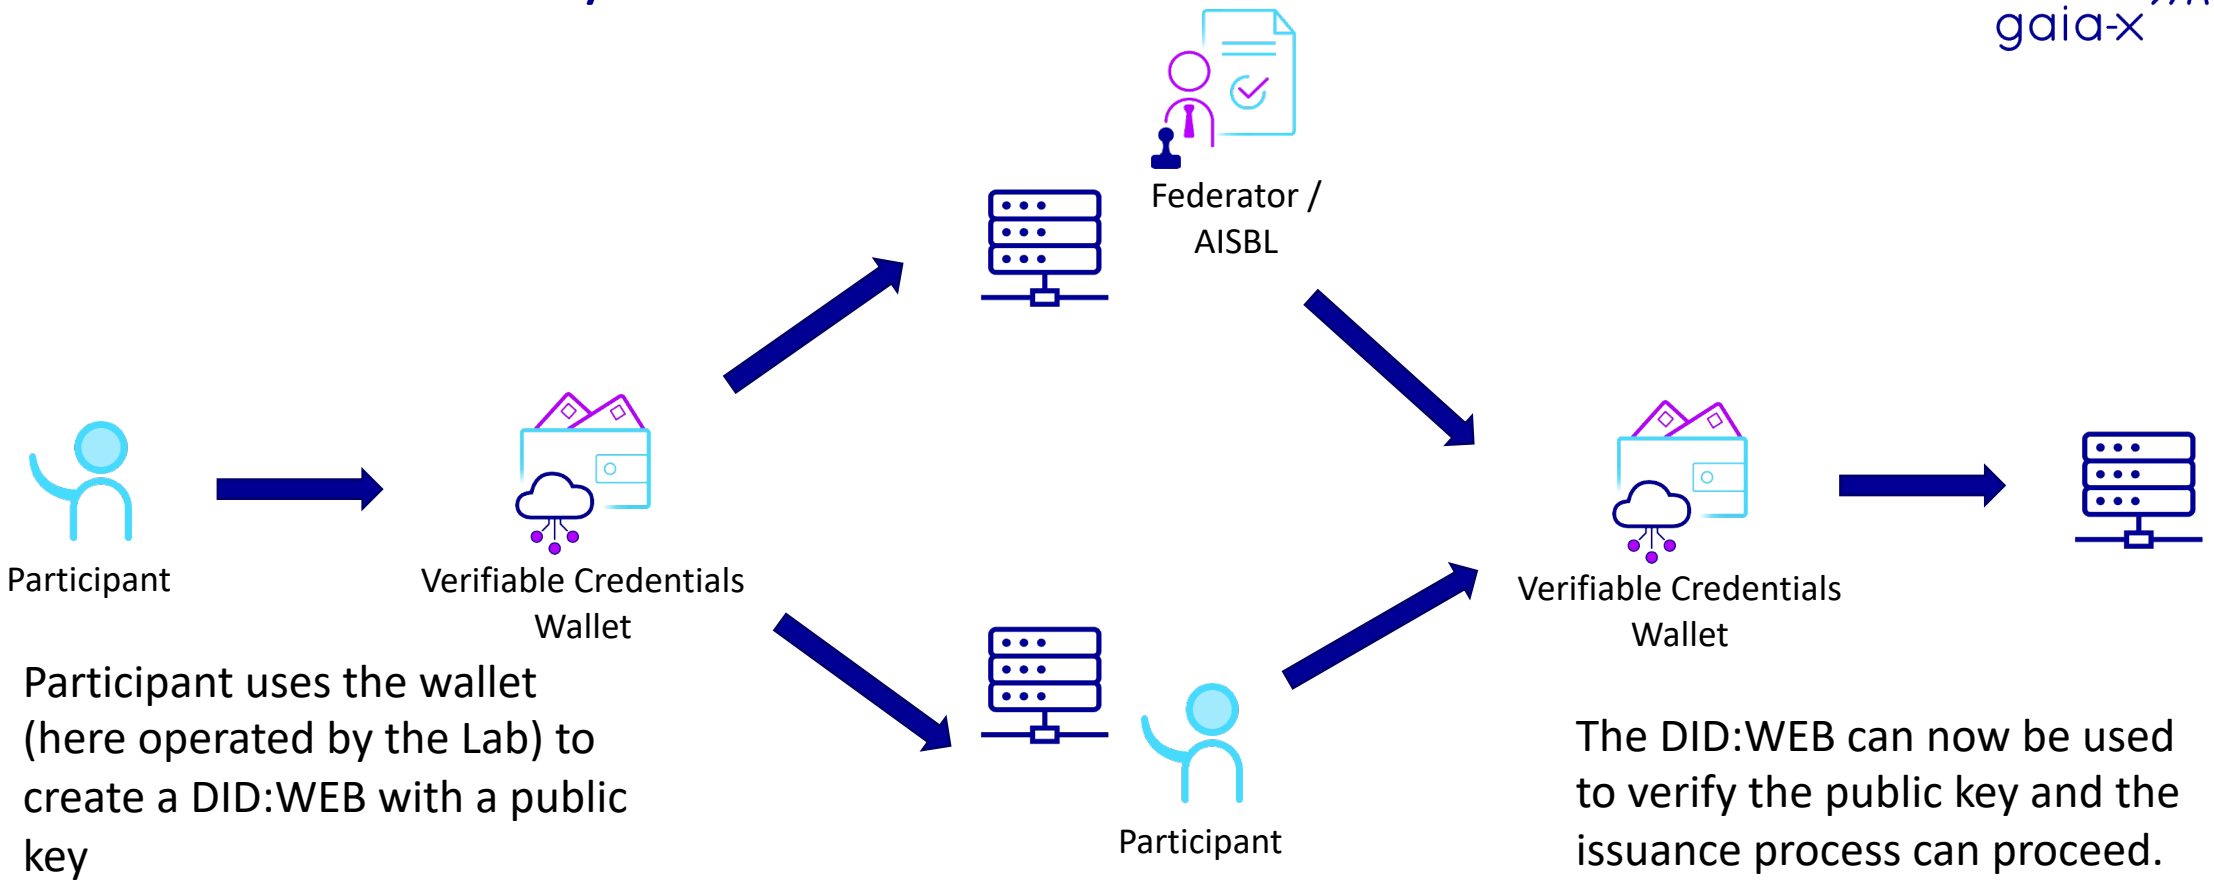


2. Type your email that you also used to register on GitLab. If your email is not registered, you will not get an email and cannot issue a Participant Credential. Click on *Submit.*



3. Check your emails. You will receive a registration link that is valid for 24 hours. Click on the link to initiate the issuance of your credential.

Demonstration flow 2/4

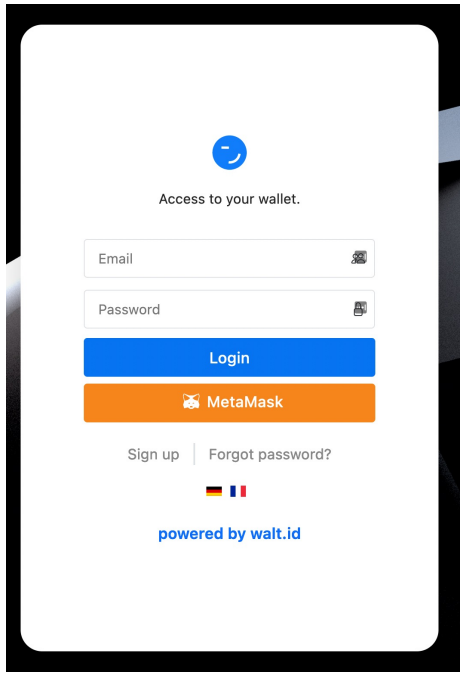


Participant uses the wallet (here operated by the Lab) to create a DID:WEB with a public key

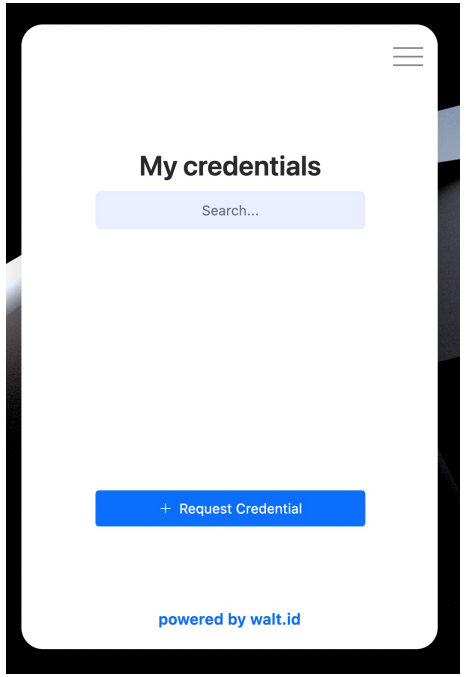
Participant exposes the DID:WEB Document via Lab Registry or an own webservice under the own domain

The DID:WEB can now be used to verify the public key and the issuance process can proceed.

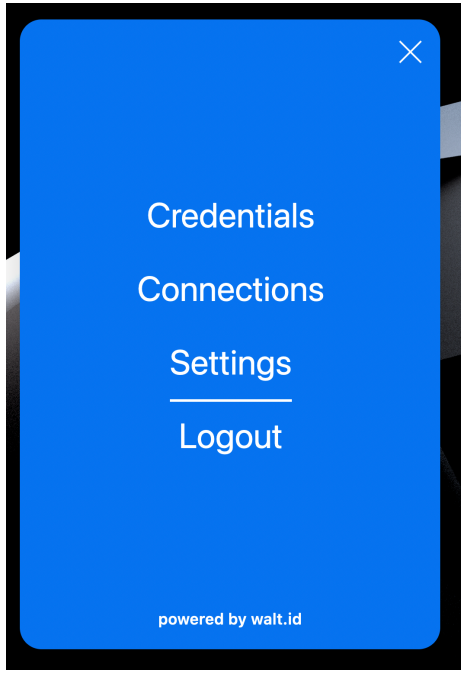
Demonstration flow 2/4



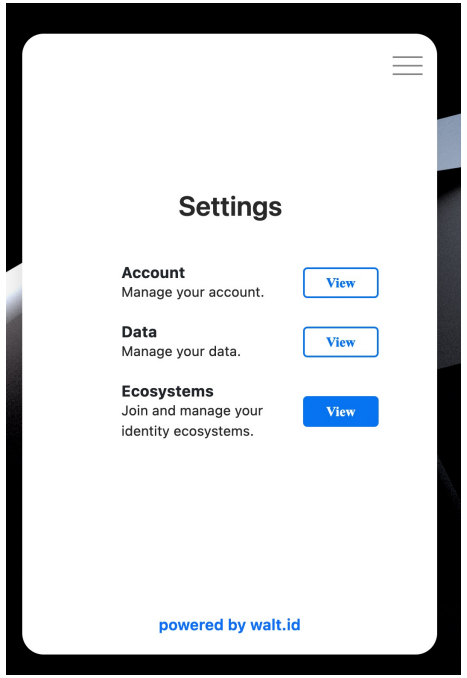
1. Visit the [Gaia-X Lab Wallet] and type a new email and password combination that you can remember.



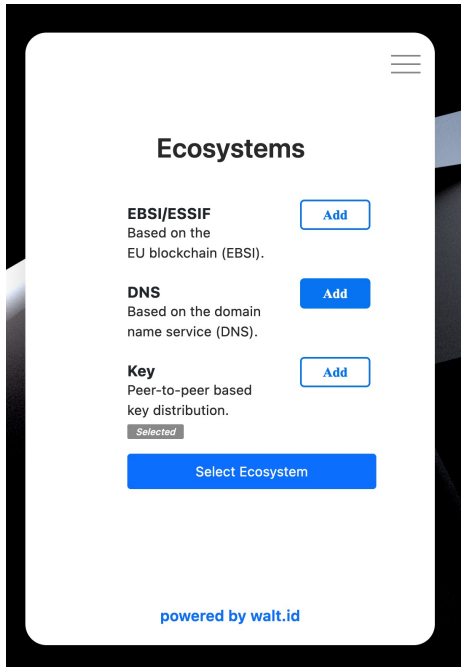
2. If you used a new account, an empty credential page will be shown. Click on the hamburger menu in the top right corner.



3. The menu opens. Select *Settings* to setup your account.

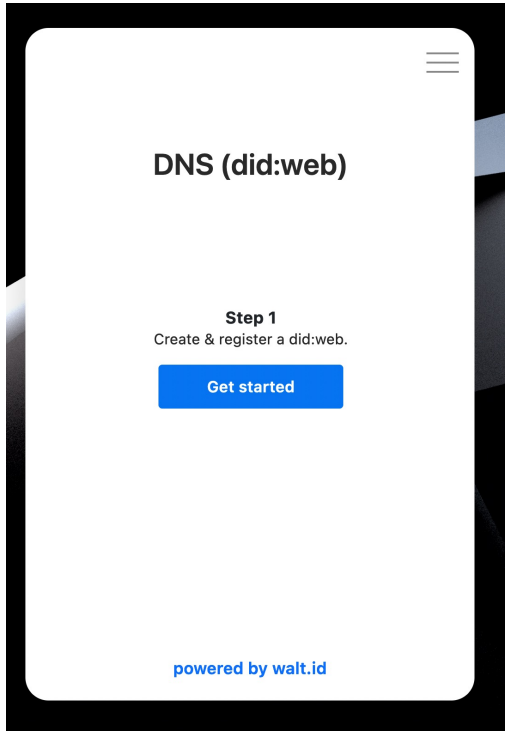


4. There are different aspects that you can manage in your wallet. We are interested in the Ecosystem setting for now.

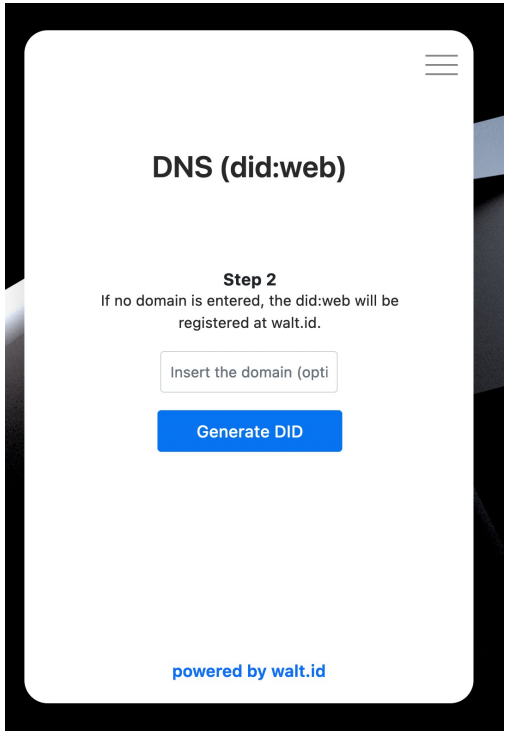


5. We want to use did:web, so we click on *Add* for the *DNS* option.

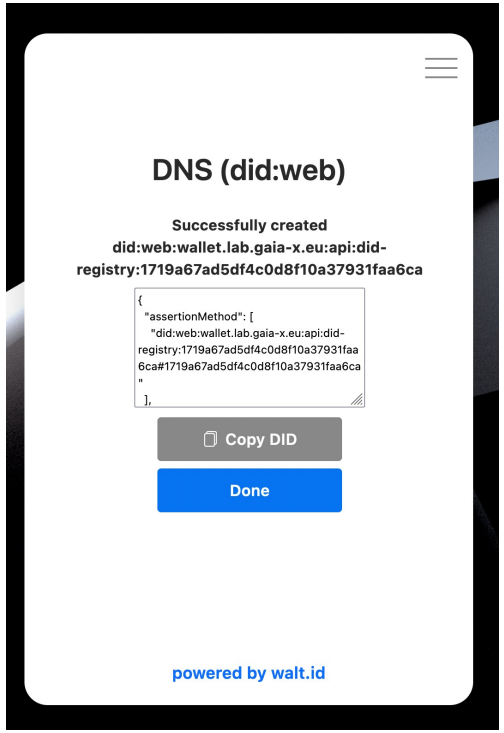
Demonstration flow 2/4



1. The Setup Wizard begins. Click on *Get Started* and follow the steps.

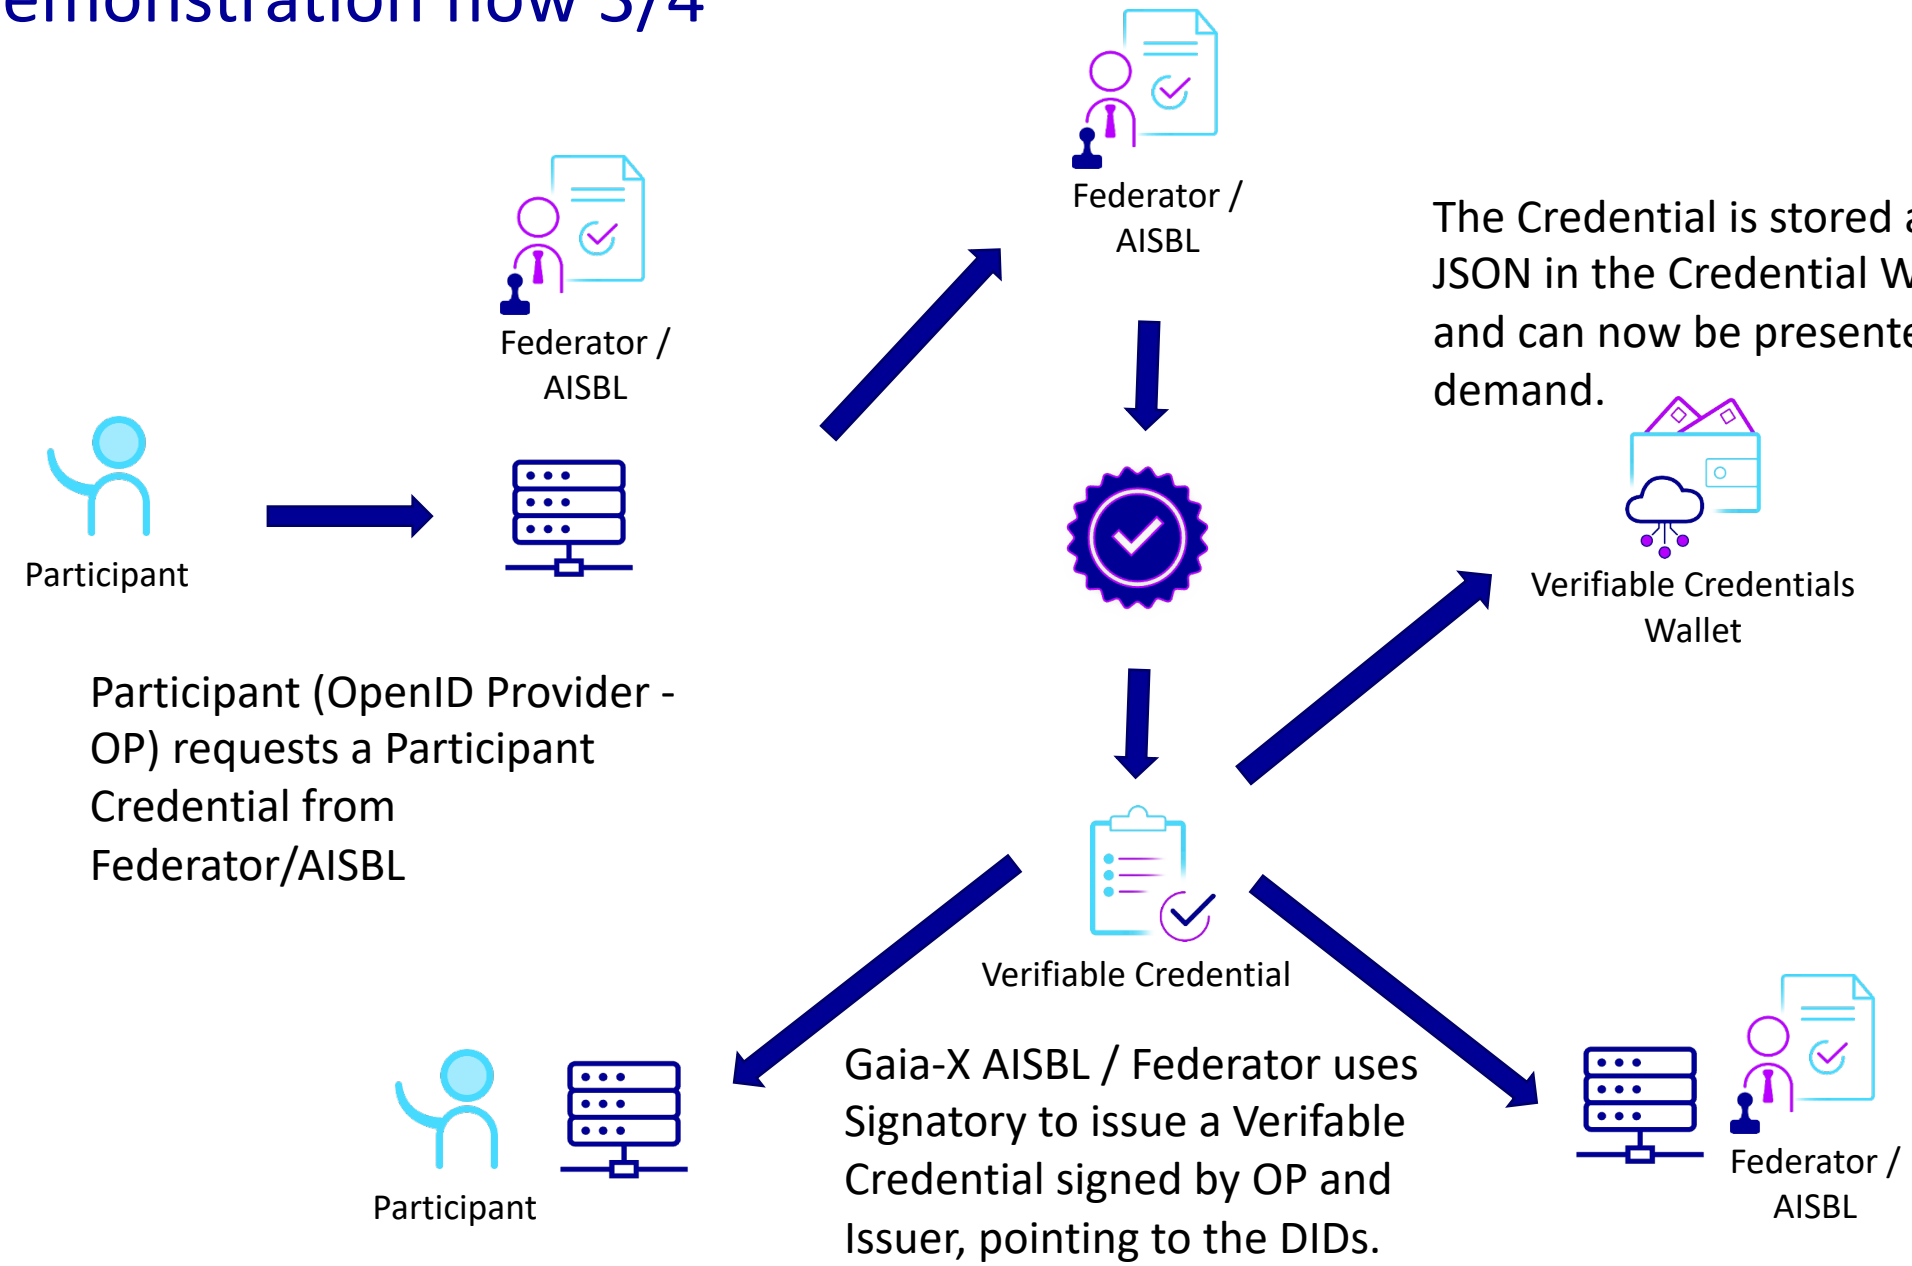


2. You can now enter a domain that you control. If you do not enter a domain a default domain of the demonstrator will be used. Click on *Generated DID.*

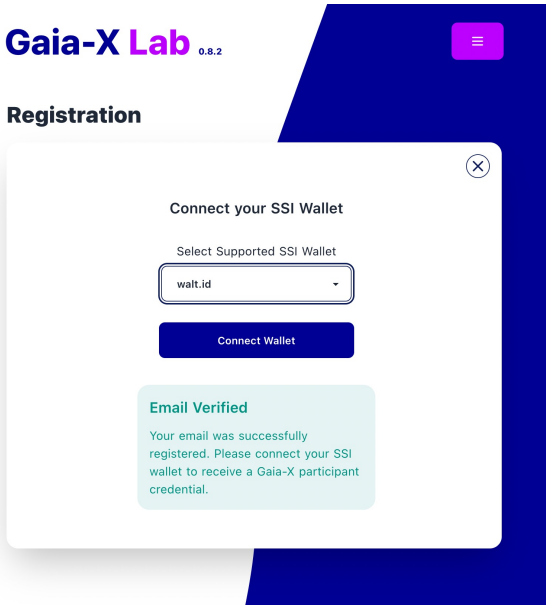


3. Your did:web was successfully created. You can now copy the DID to inspect it in detail, use it somewhere else or just close the window.

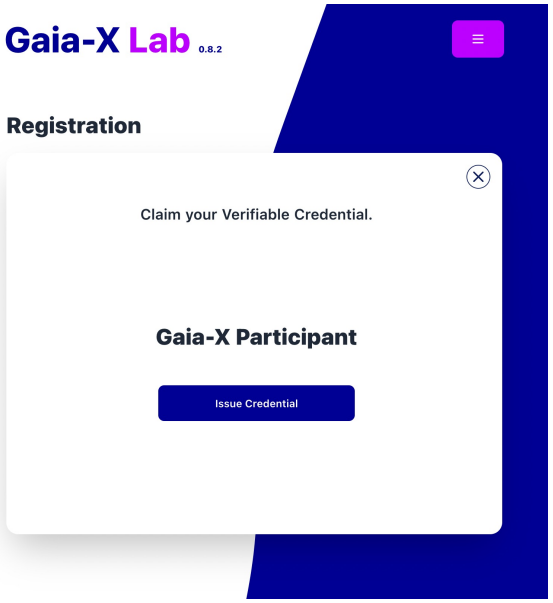
Demonstration flow 3/4



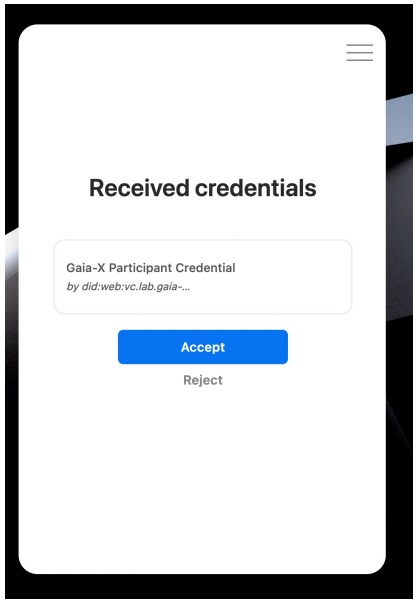
Demonstration flow 3/4



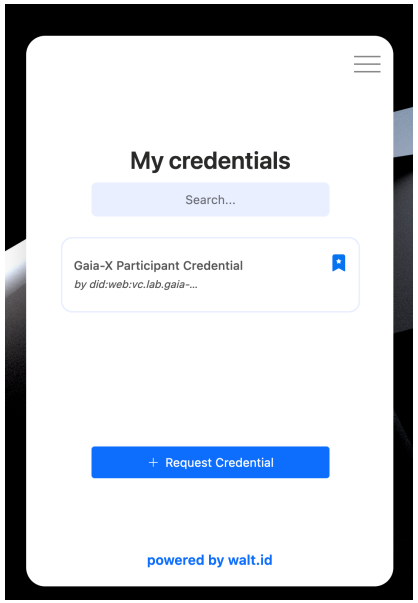
1. Click on the link from the email that you received. If your token is considered valid you can choose your wallet and click on *Connect Wallet.*



2. You can now issue your credential. Click on Issue Credential and the onboarding API will prepare a new credential for you. You will be redirected to your wallet to accept the credential.



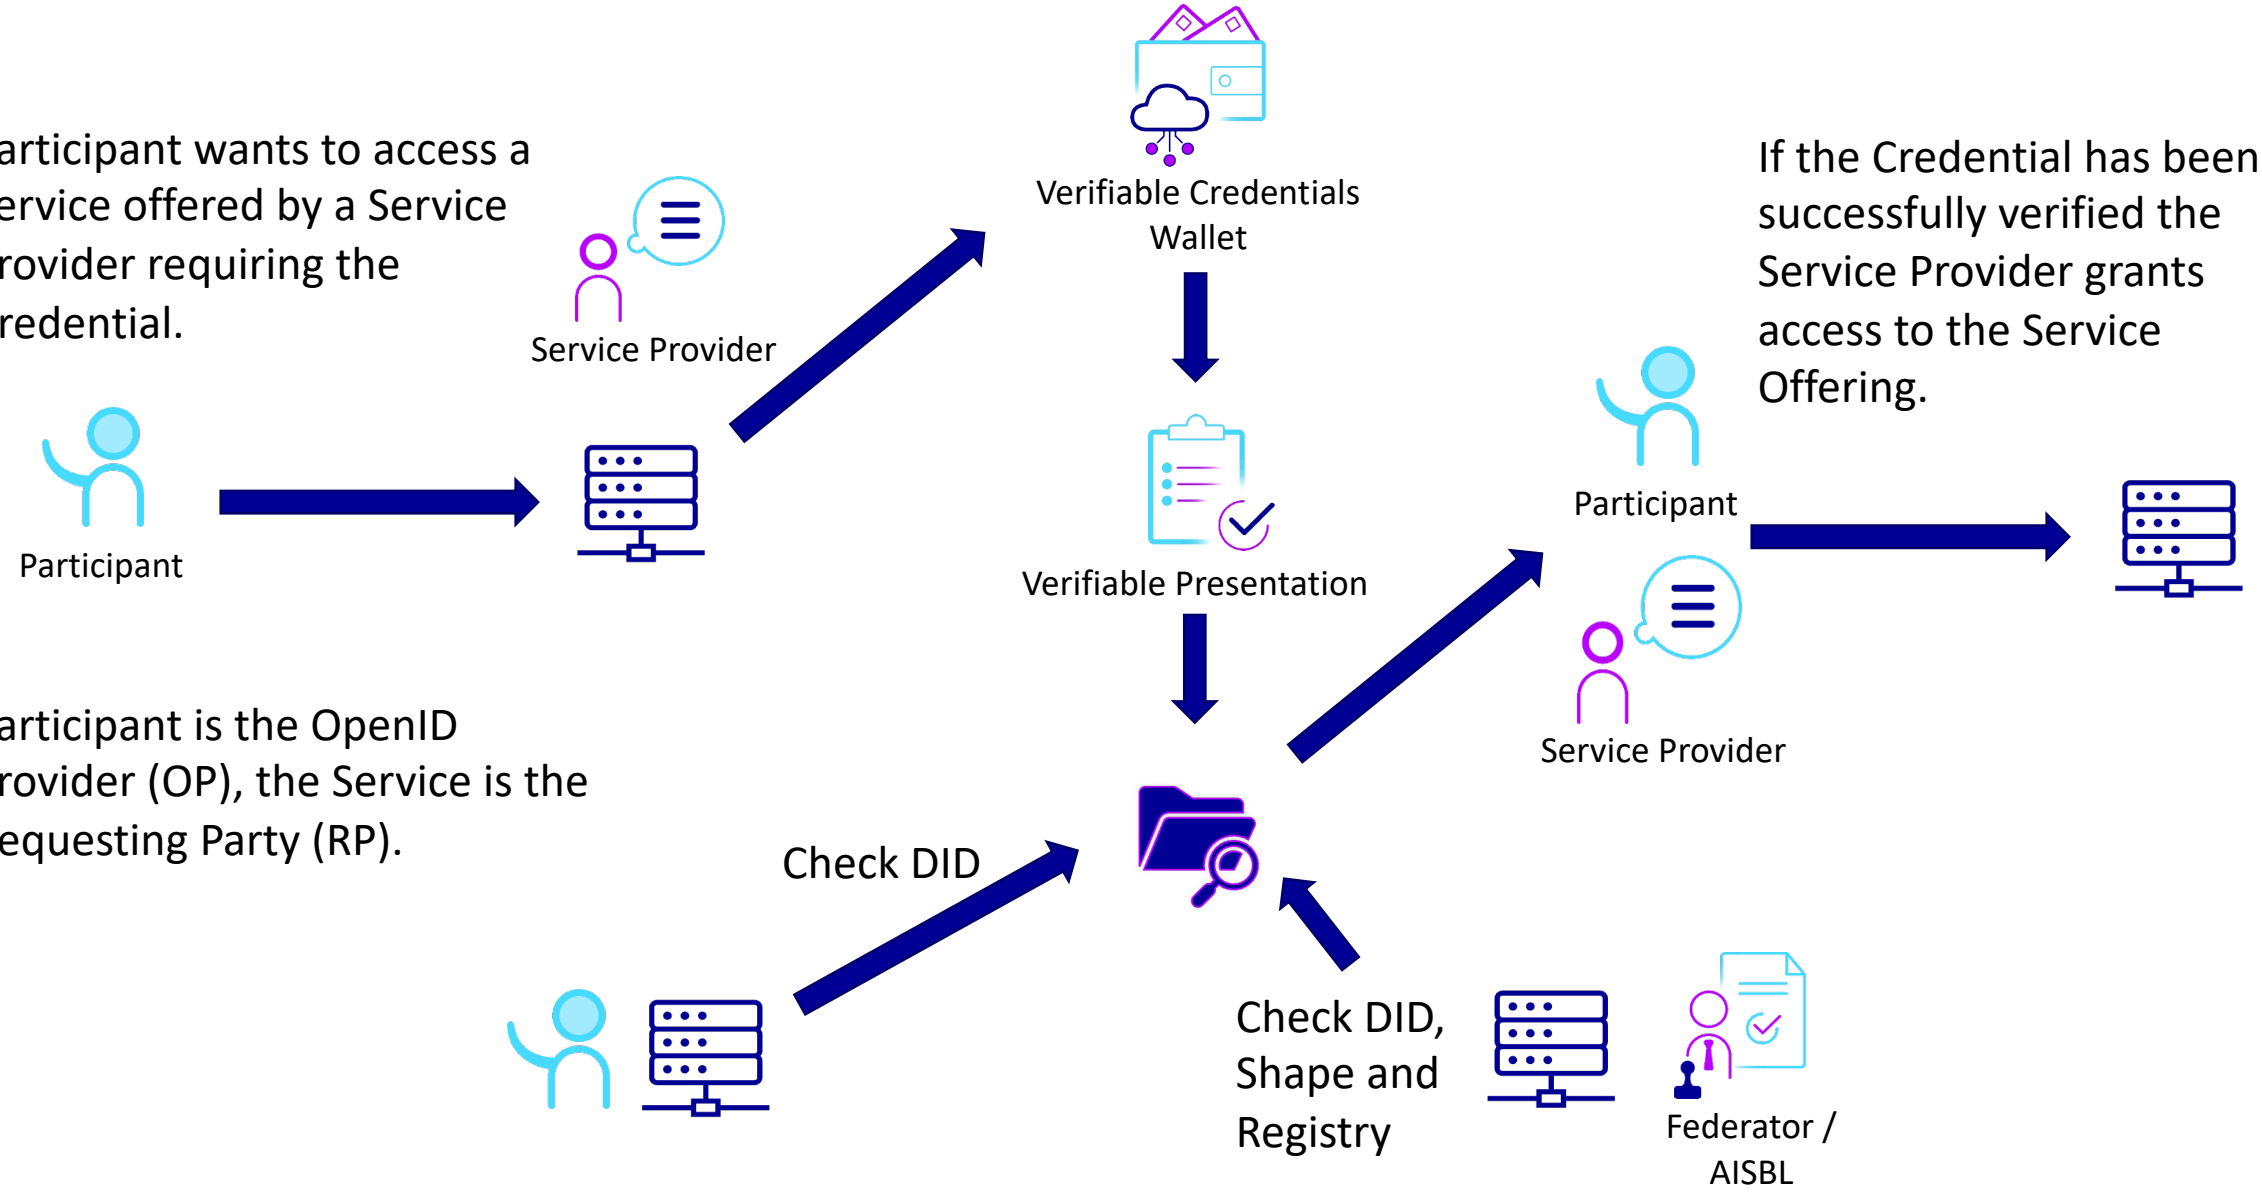
3. You received a credential. Click on the credential to view its content first. Click on *Accept* next if you want the credential in your wallet.



4. Your credential was successfully added to your wallet. You can use it now to create verifiable presentations.

Demonstration flow 4/4

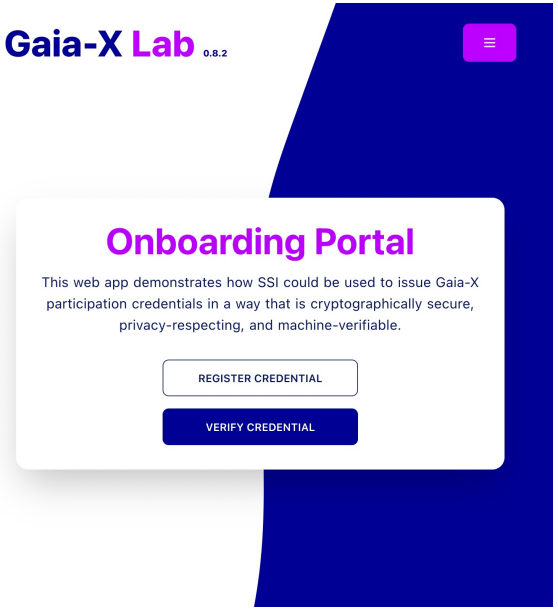
Participant wants to access a Service offered by a Service Provider requiring the Credential.



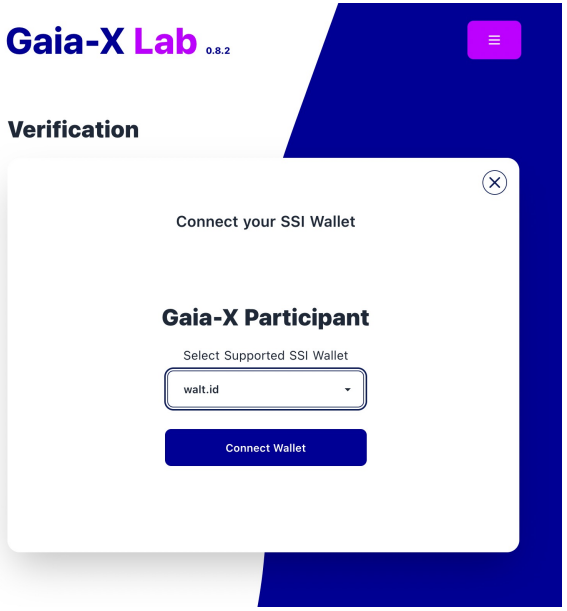
If the Credential has been successfully verified the Service Provider grants access to the Service Offering.

Participant is the OpenID Provider (OP), the Service is the Requesting Party (RP).

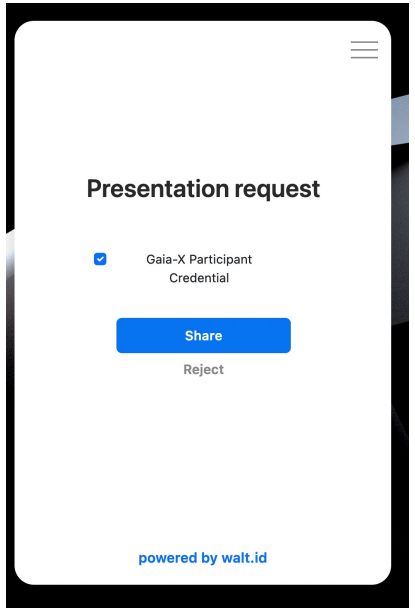
Demonstration flow 2/4



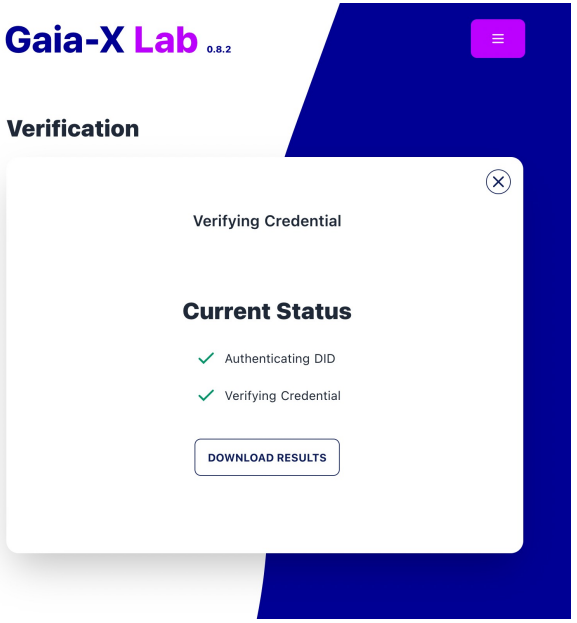
1. Visit the Gaia-X Lab Onboarding Portal and select Verify *Credential.* This will start the verification process.



2. Select your wallet and click *Connect Wallet.* This will open a new tab with your wallet.



3. Your wallet allows you to select which credential you want to present to the requester. Select your credential and click on *Share.*



4. The Onboarding Portal will verify your credential if your credential is valid, you can download the results to share it with others.

What has not been shown?

- The Participant would have checked the Credentials of the Service Provider
- The Credentials will be used to increase trust in Service Providers and Service Offerings
- Many Verifiable Credentials can be combined to Verifiable Presentations
- The Verifiable Presentations will be part of the Service Offerings in the Catalogue
- The Registry can be used to revoke, i.e. the rights of an issuer, and this would lead to invalid Credentials
- The Issuer and the Verifier are the parties the Trust has been delegated to.

Summary – Triangle of Trust
